LEGACY

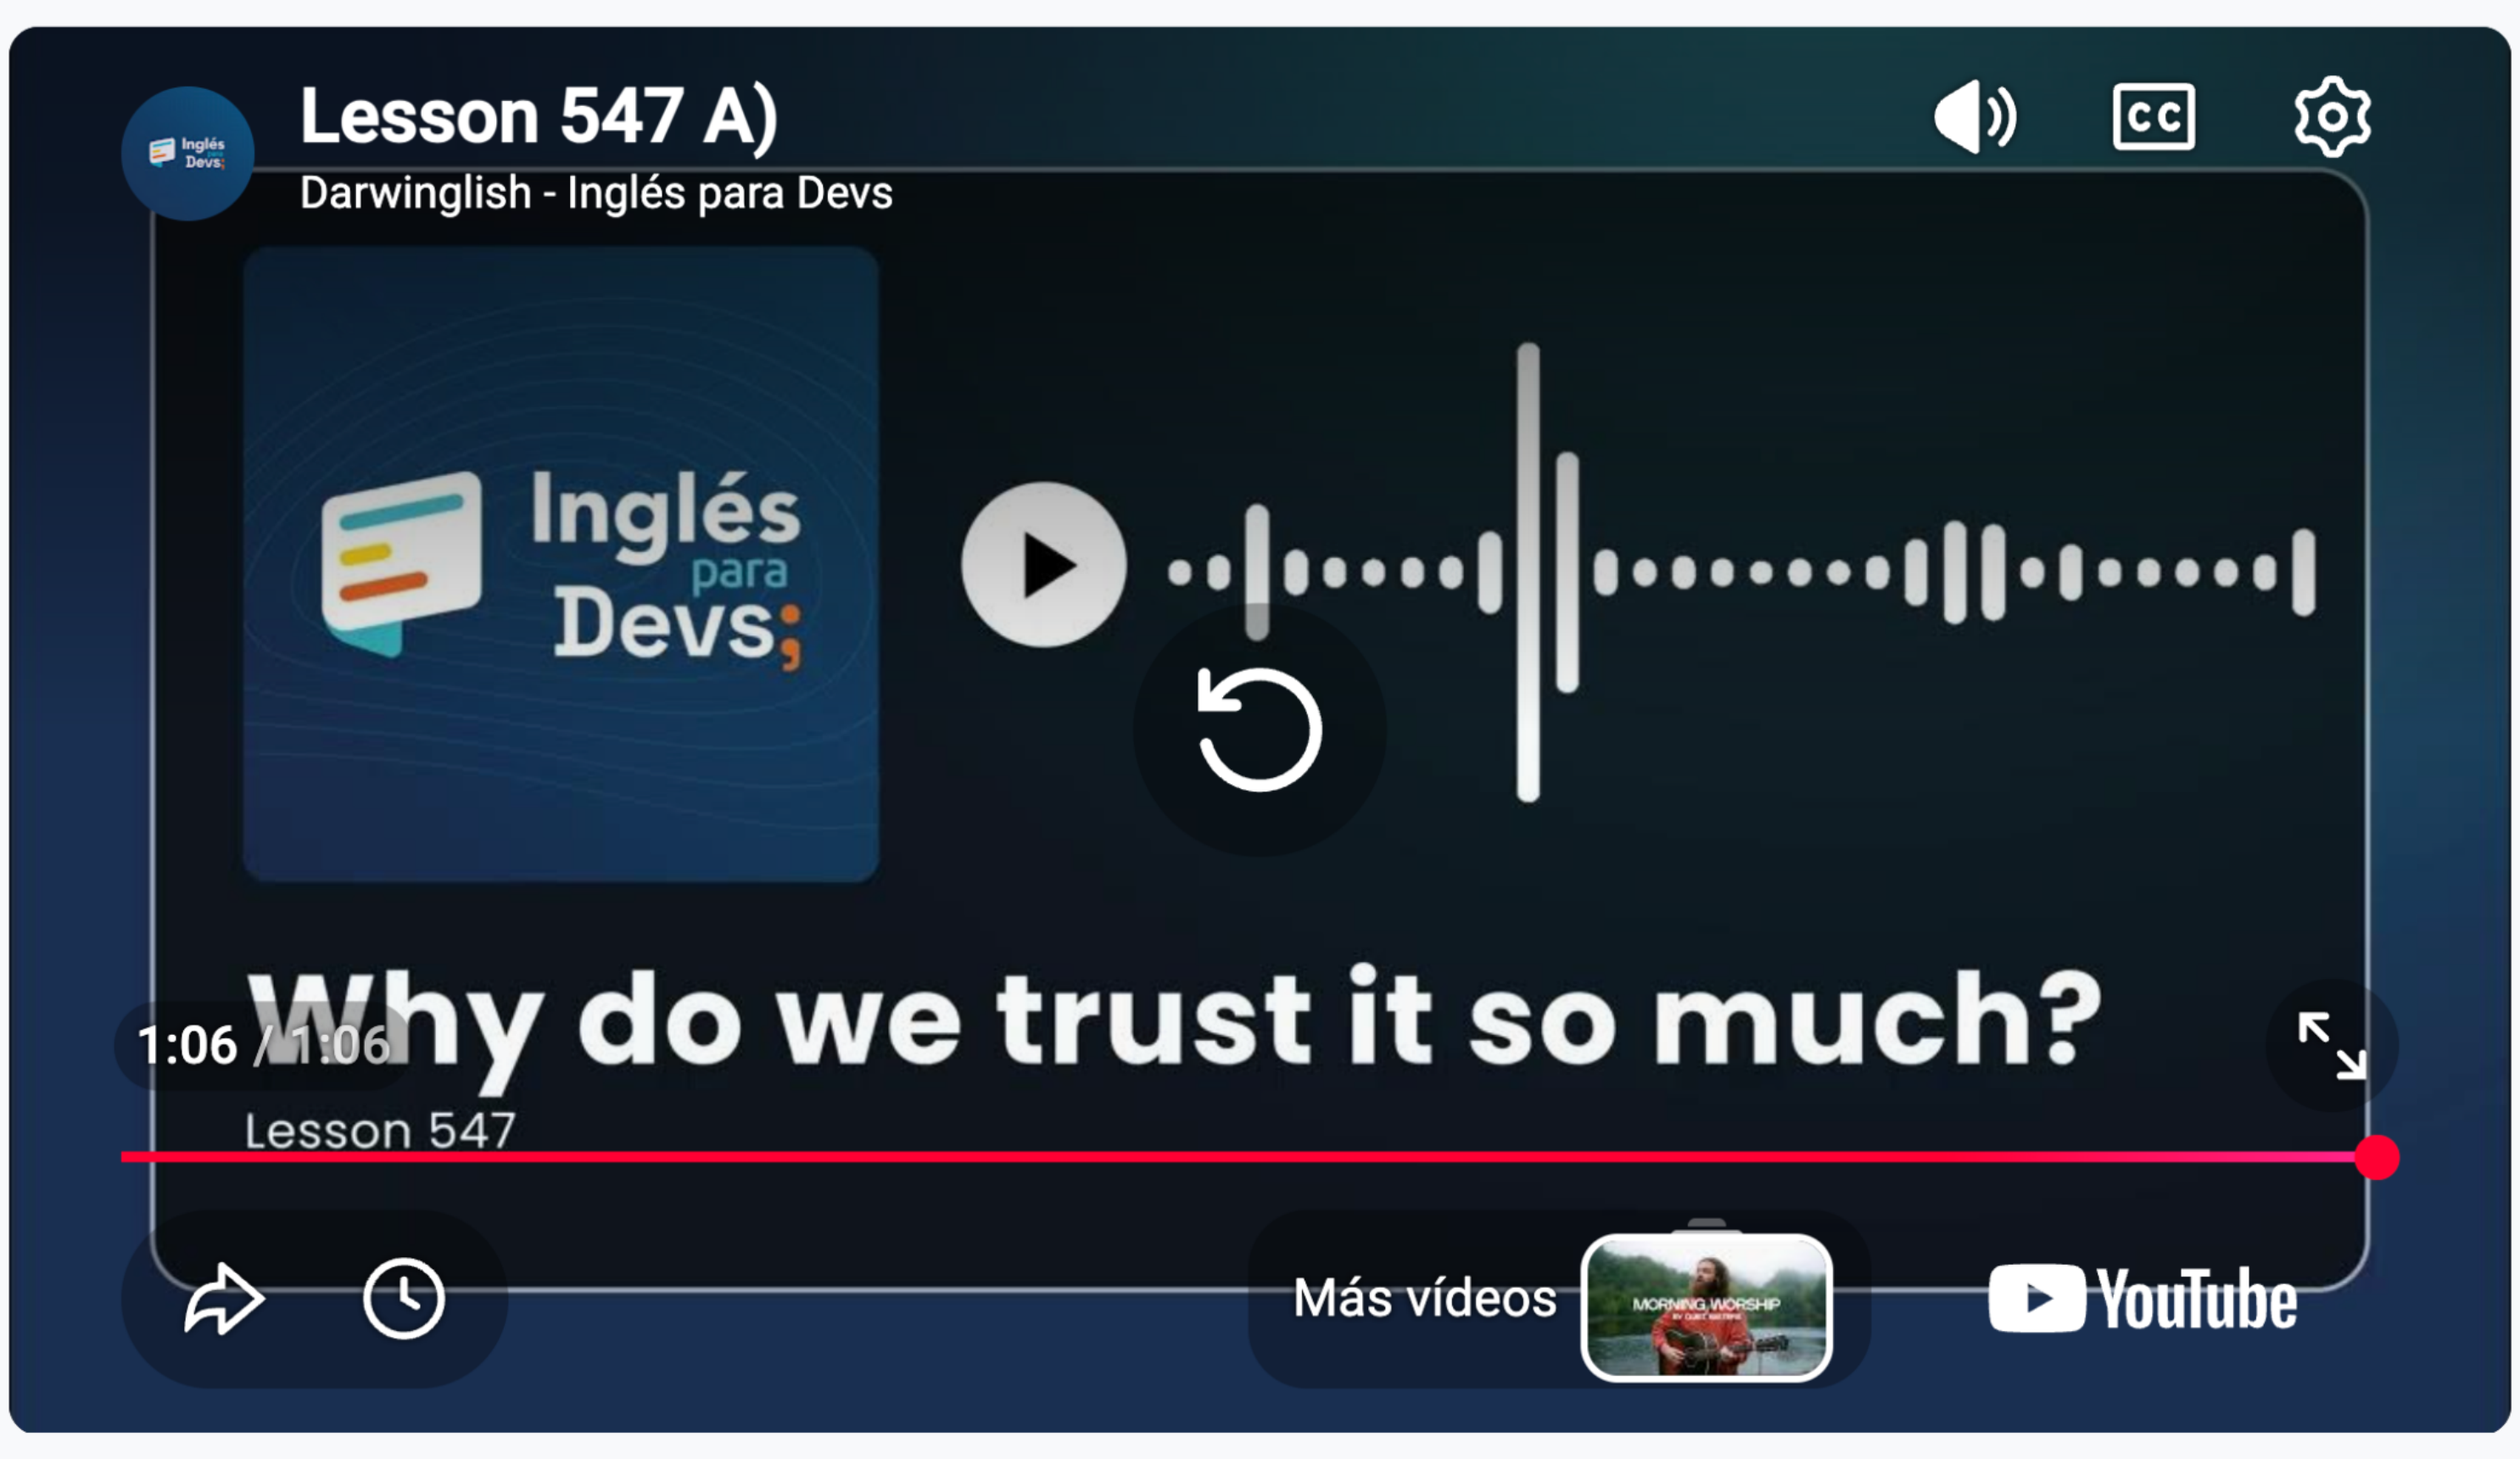
Why do we trust it so much?

Conversation strategy. Using rhetorical questions to make a point.

1 **Read the three research findings. Are these results surprising to you?**

- Around 70 percent of developers say they use AI-assisted tools such as code copilots at least occasionally, but fewer than 30 percent say they always review the code those tools generate.
- Many companies have adopted AI tools across their workflows without establishing clear guidelines for how or when their teams should use them.
- Studies have found that developers who rely heavily on AI-generated code are more likely to introduce security vulnerabilities — not because the AI is always wrong, but because users often accept suggestions without fully understanding them.

2 **Listen carefully to the podcast. What is the main concern Lucas and Sofía have about AI tools?**



LUCAS & SOFÍA — DEVTALK PODCAST 🔈 AUDIO

Lucas I think the main issue with AI tools right now is that we use them without really questioning what they produce. Take code copilots, for instance. You get a suggestion and you just… accept it.

Sofía Oh, I know exactly what you mean.

Lucas *I mean, can all those suggestions really be correct?* Some of them look fine on the surface but they're not optimal, or worse, they introduce bugs.

Sofía Right, and look at how people use AI for code reviews. *I mean, why do they assume the AI catches everything?*

Lucas I know. I imagine most developers don't really read what the model outputs before merging.

Sofía And then companies make all these bold claims — "our AI cuts development time in half," or "zero bugs with AI testing." *Do most engineering managers really believe that stuff?* I think a lot of those claims are exaggerated.

Lucas Yeah, I have to say, we're not very critical about AI tools, generally.

1. **What is the main concern Lucas and Sofía have about AI tools?**

Tu respuesta...

3 **Notice how Lucas and Sofía use rhetorical questions to make their point. They don't expect each other to answer these questions. Find two more examples in the conversation.**

Example: *… can all those suggestions really be correct?*

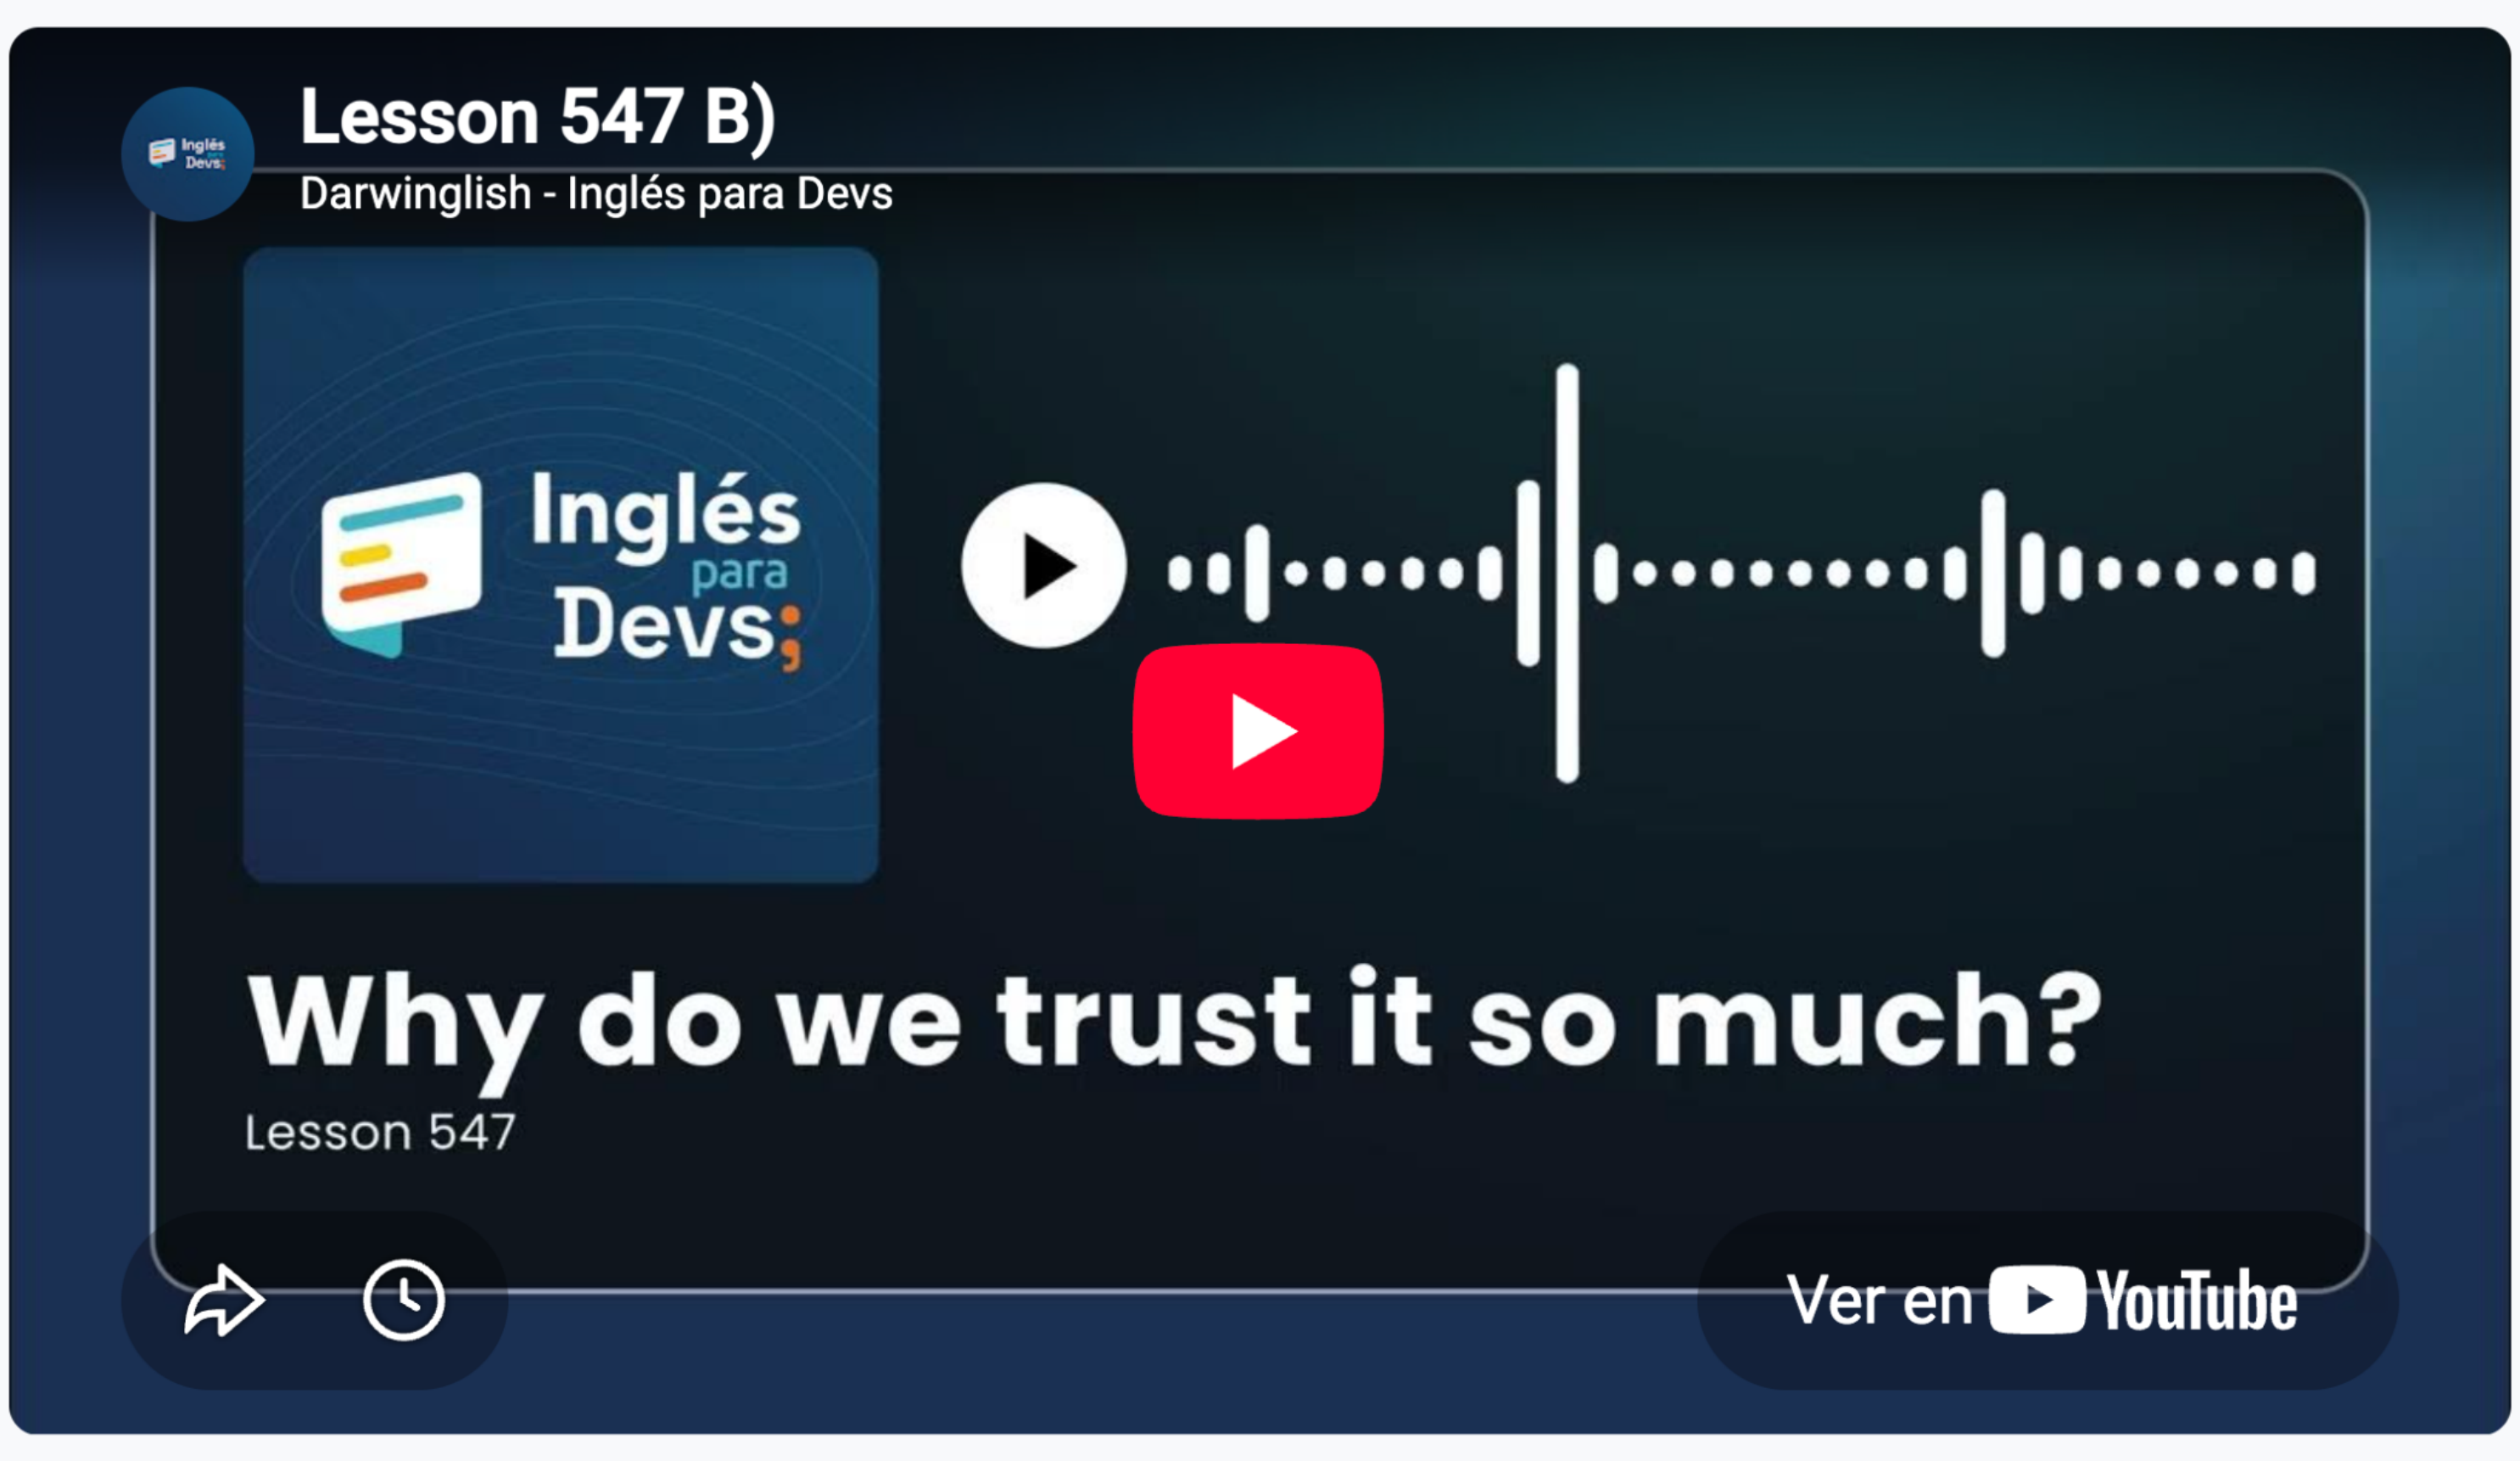
1. **Another rhetorical question from the conversation:**

Tu respuesta...

2. **One more rhetorical question from the conversation:**

Tu respuesta...

4 **Listen to the rest of Lucas and Sofía's conversation. Then match each statement with the correct rhetorical question. Choose one question and explain whether you agree with the point it makes.**



1. Yeah, I guess. My team started using an AI testing tool last month without really understanding how it works. _____ It's so important to know the limitations.
2. It is. But part of the problem is that these tools are moving so fast. _____ There's always a new model, a new release.
3. And the trouble is, a lot of developers don't have a strong foundation in security or architecture. _____ Everyone just relies on the AI to figure it out.
4. I know. I think we've just stopped asking hard questions about the tools we use. _____

a. Why don't teams slow down and evaluate?
b. Isn't it kind of reckless?
c. Why don't they teach this in bootcamps?
d. Who has time to audit every output?

1. **Choose one of the rhetorical questions and explain whether you agree with the point it makes.**
